

QA guide: How to test cost of work

For QA testers · Cabinet Studio (interiors)

Test on the **live website** — no local install needed · About 15–20 minutes

Open this URL (live app):

<https://Danish-13-Khan.github.io/interior-cabinet-vision-go/>

Use Chrome or Safari. Log in or register if asked. You do **not** need the developer's computer or npm.

What you are testing

Can a designer open a Living Room project, turn on the interior estimate, enter rates, see a cost total, and freeze a quote?

This is the **Project tools** flow. Report Center cabinet cutlist costing is separate — not required here.

Pass or fail

Result	When to use it
Pass	The screen matches the expected result.
Fail	Wrong total, rates ignored, crash, or missing button.
Blocked	The live site will not load, or you cannot open Living Room.

On fail: note date, browser, the URL above, steps, and attach a screenshot.

Happy path (do this first)

1. Open the live URL → start or open a **Living Room** project.
2. Click **Project tools** (top bar).
3. You should see six tabs: Estimate, Finishes, Price book, Client, Payments, Company.
4. On **Estimate**, tick **Include all rooms and interior items in the proposal**.
5. Under **Your rates by category**, type a rate for every category (examples below).
6. Check that “items need a rate” goes toward **0** and **Additional cost** shows money.
7. Open **Price book** → set e.g. wallpaper 80, tile 120, LED driver 150.
8. Peek at **Finishes** and **Client** (sample name + phone).
9. Open **Payments** and **Company** — you may only see a higher-plan message. That is OK.

10. Close tools → **Present** (or Review) → **Freeze**. Freeze should succeed.

Example rates (you can copy these)

Category	Example rate
Ceiling finish (per m ²)	45
Wall finish (per m ²)	80
Floor finish (per m ²)	120
Decor (each)	80
Lighting (each)	150
Electronics (each)	150
Seating (each)	350
Storage (each)	280
Tables and desks (each)	200

Spot check: Floor finish $\approx$ quantity $\times$ rate (example: $21.84 \text{ m}^2 \times 120 \approx \mathbf{2,621}$).

Exact grand totals change with room size. Prefer: line cost $\approx$ qty $\times$ rate, and missing-rate count $\rightarrow$ 0.

Test cases

1. Project tools opens

Do: Click Project tools.

Expect: Six tabs.

Pass if: Dialog opens with all tabs.

2. Turn estimate on

Do: Tick “Include all rooms...”.

Expect: Additional cost + items needing a rate.

Pass if: Status updates.

3. Enter category rates

Do: Fill every category (table above).

Expect: Missing-rate count falls; positive Additional cost.

Pass if: Numbers update; no crash.

4. Line include / waste / override

Do: Uncheck Include; set Waste 10%; raise one line Rate.

Pass if: Totals move the right way.

5. Price book

Do: Wallpaper 80, tile 120, LED driver 150. Zero = not set.

Pass if: Values remain after close/reopen tools (same browser).

6. Finishes

Do: Change a finish or colour.

Pass if: No crash.

7. Client

Do: Name + phone (e.g. Priya Sharma, 9876543210).

Pass if: Fields accept input.

8. Payments

Expect: Payments UI or clear Professional/Company message.

Pass if: Not a blank broken page.

9. Company

Expect: Company UI or clear Company-plan message.

Pass if: Clear message or UI.

10. Freeze

Do: Freeze from Present/Review after rates are filled.

Pass if: Freeze completes; later live edits should not silently rewrite the frozen quote.

11. Lights (optional)

Do: 3D → Room lights → add Pendant or Cove LED strip → set Kelvin (3000 or 4000).

Pass if: No crash.

OK not to fail for these alone

- Payments / Company only show an upgrade message on Designer — expected.
- Cabinet manufacturing cost also lives in Report Center → Costing.
- Grand total differs by room — check line math, not one fixed total.
